Subject: How to produce EPS image file with preview???
Posted by jyli on Sun, 08 Sep 1996 07:00:00 GMT

An EPS graphics file may contain two graphics file formats: the PostScript
code which determines how the graphic looks when it is printed
(required), and a TIFF or PICT preview image, the version you see on the
screen (optional). That is all I know about this subject.

 I'd very much like to learn how to produce an EPS image with a preview,
in particular the one that is recognized by Microsoft Word.

many thanks,
