Hi

I've been battering my brains for 4 hours now, trying to turn a pixel (any pixel) on in a DRAW_WIDGET. This is my first attempt at RSI IDL

This is what I have done

- created a dialog box with WIDED, containing a DRAW4 widget, mouse events enabled, no scroll

- saved the .WID file, created a .PRO file from WIDED's file menu

- changed the default case statement for DRAW events to

BEGIN

PLOTS, event.x, event.y, /NORMAL, COLOR=13

print, event.x, ' ', event.y

- compiled the PRO file from IDL

- ran the applet

The cursor positions (event.x,y) are printed, but no plotting is done

Can anyone help me?
