Hi

I've been battering my brains for 4 hours now, trying to turn a pixel (any pixel) on in a DRAW_WIDGET. This is my first attempt at RSI IDL

This is what I have done

- -created a dialog box with WIDED, containing a DRAW4 widget, mouse events enabled, no scroll
- -saved the .WID file, created a .PRO file form WIDED's file menu
- -changed the default case statement for DRAW events to BEGIN

PLOTS, event.x, event.y, /NORMAL, COLOR=13 print, event.x, '', event.y

- -compiled the PRO file from IDL
- -ran the applet

The cursor positions (event.x,y) are printed, but no plotting is done

Can anyone help me?
