
Subject: CALL_EXT with SunOS

Hi all,
I have a large IDL/FORTRAN package that I've ported to VMS Alpha,
SGI, and Solaris. When I tried SunOS, CALL_EXTERNAL fails with the
error

ld.so: mmap error(22)

Does anyone know what would cause this error? The shared image linked
with no errors or warnings. Compile line was
cc -O -PIC -c
and link line was
ld -o TEST_SHARE \$(OBJS) \$(LIBS)

Thanks,
bob
