Subject: "shrink" structures

Hi,

I usually read ascii tables using read_ascii with a ascii template which gives me an anonymous structure with fields of the same length.

for example d=READ_ASCII('file', TEMPLATE=templ)

afterwards d is d.date, d.time and d.value

I would like to "shrink" d to contain only a specific date.

Something like ind=where(d.date eq '10052000') d = d[ind]

This doesn't work of course but I thought at least d.date = d.date[ind] should. But this doesn't resize d.date but only fills all locations with the values of d.date[ind].

Is there any other way than to copy everything to arrays?

Regards,

Johannes
