Hi,

I am currently using my serial port, via IDL, to command a motion controller. It works fine with the serial port dlm from the ITT code library. Of course, I want to control more stuff, so it seemed USB was the way to go, but before attempting to build my own USB dlm, I was hoping someone has already done so.

Possibly Ron Kling's "generic interface for calling Windows DLL functions directly" on his Kilvarock website could be one approach, but I don't know much about Windows DLL functions.

I'm running 7.0 on 64 bit Win7.

Thanks!

Bill
