---

I am working on a batch in ENVI+IDL code which reads georeferenced images (ENVI supported images) using:

```
envi_open_file, fname, r_fid=fid, /NO_INTERACTIVE_QUERY, /NO_REALIZE
```

the problem comes when I try to open geoTIFF images with a spatial reference system (ETRS89 / UTM zone 30N, EPSG:25830). Then, the "TIFF World File Input Projection" dialog appears. Is there any way to avoid that window or catch the error that makes this window come up?

Thank your very much

Txomin
