I don't know. Maybe you are assuming the event gets consumed as soon as it gets queued. Are you using the normal XManager event handling? Maybe you are assuming that if the event gets consumed it automatically fires off the next event. Have you stepped through the code from the time the event appears in the event handler to confirm this?

I've seen silent error handlers show symptoms like this. :-)

I just think the chance of it being anything but a programming error is very small. I don't know which of your programming assumptions is faulty, but I'd be some money one of them is.

Cheers,

David
