
Subject: Changing font on iPlot legend

So, I've created a nice looking plot using iPlot with a legend for each line (using the /INSERT_LEGEND keyword).

Now I would like to change the font name to "Symbol" so that a W is rendered like a capital Omega (ideally I would like to put an equation in but that's a different story). I can get the legend item identifiers easily enough:-

```
idTool=IGETCURRENT(TOOL=oTool)
ids=oTool->FindIdentifiers("*plot legend item*")
```

but have tried both code like

```
void = oTool->DoSetProperty(ids[i], 'FONT_NAME', 'SYMBOL')
```

and

```
o=oTool->GetByIdentifier(ids[i])
o->SetProperty, FONT_NAME='Symbol'
```

all without success. I assume that since it can be changed on the legend item property sheet it should be possible programmatically.

ITT: Why oh why is everything with iTools so cryptic and complicated? I used to think of myself as a bit of an expert but now feel like an idiot!

Can anyone help?

Regards,
Cliff
