Can anyone help,

I'm trying to read an HDF5 file on MacOS10.5.8 using IDL 7.0.0.0.

When I query the file (H5F\_IS\_HDF5(fname)) all is OK but the moment I try to get a handle ( file\_id = H5F\_OPEN(fname) ) IDL generates a fatal error and dies completely (needing me to kill it).

Any help?

Thanks
