Hi,

i have written a file in fortran this way:

```
write(444,'(e14.6,1x,e14.6,1x,e14.6)',advance='yes') A, B, C
```

where A has a value of  $2.10^{60}$  and the other ones 0.0000000

The file is printed correctly but when i want to read it with IDL:

```
readf,11,format='(e14.6,1x,e14.6,1x,e14.6)', A, B, C
```

It displays Inf for A and 0.0000000 for B and C.

However, it is the same format I don't understand why it prints Inf for A ( even if i initialize A = 0.d0)

If somebody could help, it would really help me !

Thanks
