I want to create a structure with 2 fields. The fields need to be of variable length. I need to have 'n' such structures, where 'n' is scalar number. To address the issue of variable length field, I create pointers for each field(pointing to variable temp for initialization) as shown below:

```
mystruct={l1:ptr_new(temp), l2:ptr_new(temp)}
```

I don't know how to create copies of this structure. Replicate doesn't work as I guess it creates shallow copy.
any suggestions?
