Hi Allard,

Thank you for your explanation. It helped me to understand what are you doing in your code...

I started doing some tests and now I have a problem.

On my first execution I forget to destroy the idl_idlbridges and now if I try to create another bridge I get a "bus error" and I can't continue.

Your code is not bad and definitely it would be better if the cgi_process_client could know the procedure/function to start. Creating .SAV files to pass the parameters is a little bit tricky but I can't imagine another way to do pass objects, structures, etc.. to the bridge.

Perhaps another feature to improve could be the possibility to collect output data. It's possible to use the GetVar from the IDL_IDLbridge and, actually, I don't how I would add this but it would be cool!

Thanks again Allard. Have fun!

nata
