Hi Allard,

Thank you for your explanation. It helped me to understand what are you doing in your code...

I started doing some tests and now I have a problem.

On my first execution I forget to destroy the `idl_idlbridges` and now if I try to create another bridge I get a "bus error" and I can't continue.

Your code is not bad and definitely it would be better if the `cgi_process_client` could know the procedure/function to start. Creating `.SAV` files to pass the parameters is a little bit tricky but I can't imagine another way to do pass objects, structures, etc.. to the bridge.

Perhaps another feature to improve could be the possibility to collect output data. It's possible to use the `GetVar` from the `IDL_IDLbridge` and, actually, I don't how I would add this but it would be cool !

Thanks again Allard. Have fun !

natha
