Hi Allard,

I'm trying to understand your code but it's not clear for me.
It seems that you keep the input variables in an object and then you
put your specific code into `cgi_process_client...`

Anyway, I don't understand at all. Could you give us an example of how
to use your library ?. For example, if I have this program:

```
FUNCTION SUM, a  
  RETURN, a++  
END
```

And I've to run it 1000 times using different input parameters and my
computer has 4 CPUs, how could I use your library ?

Thanks for your help,

natha
