The IDL Astronomy library also has the very handy routine TAG_EXIST(), which allows you to guery structure members by name.

You would do something like this.
if tag_exist(struct, x, index=ii) then begin
 y = struct.(ii)
endif else begin
 message, "ERROR: could not find ""+x+" in structure"
endelse

TAG_EXIST() appears to be completely stand-alone, i.e. no dependencies on other functions in the library. http://idlastro.gsfc.nasa.gov/ftp/pro/structure/tag_exist.pr o
