I was trying to use the library multinet, a tool for bayesian statistics.

It requires a user-function as input.

there are some previous posts on this group discussing this problem, but they were quite old and unsuccessful.

I was hoping there were news about that.

anyway multinet is mpi-compatible, and into the External Development Guide they say

you should not call an idl function in a parallel code

(and you should not use callable idl in a code called somehow by idl).

by the way I gave up and wrote a c-code.

> wow - so you want IDL to call a C program, which wraps to Fortran, and

> which re-calls IDL?! are you sure you don't want to throw some python

> in there, just to round things out :)?
