Subject: SAVE
Posted by fgg on Thu, 13 May 2010 20:05:44 GMT

Hi there,

I'm running a procedure that has lines in it such as:

(Scope_VarFetch('data', LEVEL=1, /ENTER)) = 1

... that are used to save variables to the main IDL level. I'd like to
add a line at the end of this procedure to make it save all variables
that were created in a *.sav file. Something like this:

save, /variables, filename= '/Users/xxx/Desktop/example.sav'

... but it's not working. I'm getting in the *.sav file all other
variables defined in the procedure, but the ones created using
Scope_VarFetch. Any suggestions?

PS: if I run the procedure first (without the save line in it) and
then type the save line at the IDL prompt I get exactly what I want.
Just wanted to know if it's possible to automate this process.

Thank you!
