This was a bug introduced by Emacs developers into the IDLWAVE code, which unfortunately (despite my best efforts) made it into the Emacs 23.2 release. You can simply install another version of IDLWAVE separately to fix it. There is a new version of IDLWAVE with lots of cleanups and new features (including direct keyword help links in the soon-to-be-obsoleted IDL-Help-of-the-Day flavor), but I dare not predict a release given how overdue it is already.
