Thank you very much Jean,

I'm sure those advices will be useful for the next step. For now, the problem concerns the line :

```
result = image[i:i+((NSimage/5)-1),j:j+((NLimage/2)-1),0:NBimage-1]
```

the error message is :

```
Subscript range values of the form low:high must be >= 0, < size, with  
low <= high: IMAGE.  
% Execution halted at: TUILAGE      18 C:\Documents and Settings  
\Administrateur\Mes documents\tuilage.pro
```

and it still comes if I change the data type or if I transform the variable 'result' into a float array...

I think I don't write the terms of the loop properly

... if you have an idea.

thanks again for your answer
