I'm using the REGRESS routine to perform a multiple linear regression of a set of data :

$$y_i = \text{const} + a_0 * x_0 + a_1 * x_1 + \dots$$

The SIGMA keyword, returns the errors of the $a_0, a_1 \dots a_{n-1}$ coefficients, but is there any way to estimate the error of the const coefficient?

Thanks in advance!

J.
