Contact your sysadmin and ask them to restart the license manager daemon. If your system is anything like mine, it's likely that the Imgrd license manager is also managing licenses other than idl (e.g. compilers, other applications).

If any system work was/is-being performed on those applications, or if the system itself has been restarted, the license manager may have been stopped.

If the system has been restarted, it means that the Imgrd daemon has not been setup to restart upon reboot. This requires your sysadmin to add the necessary bits to the system's init.rc (or whatever it's called on your system.)

So, basically, talk to your sysadmin.

cheers,

paulv

p.s. BTW, you can run the Imgrd as a regular user to test if a non-running daemon is the problem. Read up on the Imstart and Imdown commands.
