If you have specified the /ALIGN_CENTER keyword in the
WIDGET_BASE() call when you create the base widget that is
the parent for your widgets in the row, then your widgets
should be centered.

An alternative is to use the /BASE_ALIGN_CENTER keyword when
you create the widget base that is the "parent of the parent"
of your row widgets. This often works well if you have a
column-based group of widgets, and within that you want
to have a row-based sub-group, but would like to have
everything centered.

Hope this makes sense.

Dave
