I have some data which is supplied in HDF data files compatible to HDF version 4.1r3. The HDF file contains: Annotations, RCI image and V Data-Gain settings and V data- Mode information. I opened the data (the RCI image) in ENVI and chose an ROI and now wonder how I can save it in HDF format with the same information as original data but new dimensions. I also want to change one of the variables in HDF format. I wonder if it's possible to do that in IDL or any other softwares. you may even know a reference about that which it'd be great if you send me the link so I can read how I can do that. I know there's `hdf_sd_create` in idl but think it's for creating new hdf file with new information.
