---

I'm working on the TORTOISE project for the Section on Tissue Biophysics and Biomimetics at the NIH. I'm wondering if there is an existing multiplanar viewer that could be integrated into the code so that I don't have to write one from scratch. There's a tutorial that shows how to make an MPV using iTools, but the interface is lacking. Ideally, I would want to be able to click on a point in any view and have the cursor jump to that point in the other views as well.

Thanks in advance for your help!
