
Subject: Routines for reading grib2 and BUFR

Hi all,

working with Eumetsat satellite data, I am looking for routines to read grib2 and BUFR (Binary Universal Form for the Representation of meteorological data) data directly in IDL. I have played around with the IDL grib routine, but it does not work properly for grib2 data. I know the NCL library, but since I am working in the Windows environment, it is not very comfortable. To read BUFR, I have not found anything, that seems to be applicable for me. May be there is somebody out there who faced the same problems and spent some effort to code something in IDL...

Thank for your help in advance !

Cheers,

Klemens
