Subject: out of memory using idldoc 3.2.0
Posted by Steve[6] on Thu, 22 Jul 2010 11:12:56 GMT

Hi all:
I encountered a problem today when i used the idldoc 3.2.0.
The idldoc module was installed from the idl workbench 7.1.1 as
described in Michael Galloy's website.
And I wrote a small script for generating the document such as...

PRO test_idldoc
idldoc, root='G:\lib\', output='G:\doc_out', Formate_style='IDL'
end

After compile and running, some html files generated very well,
but......
The memory increased quickly, when i monitored the memory usage in the
task management, but the CPU loading was very small.
It is not normal, right?

Best regards
Steve
