Hi there,

I'm working with IDL 6.4.1. on Unix Solaris (sunos 5.10).
I can work within the IDL Development Environment with no problem (starting with the command 'idlde'). But I would like to work within the command line mode. When I enter 'idl' in the shell I get the following feedback:

Id.so.1: idl: fatal: libIDL.so.4.3.1: open failed: No such file or directory Killed.

What is wrong ? Wrong shell ? Do I have to set a certain environment variable ?

Many thanks for your valuable responses !!

Cheers, Roman
