I don't know how to get the info once a window has been created,
but you can set the title when creating windows.

For standard graphics windows, use the title keyword, such as
  window,title='window title'

For widget windows, you can either use the title keyword
when creating a widget, e.g
  junk=WIDGET_BASE(title='window title')

or you can change the title after creation by using the
TLB_SET_TITLE keyword in a call to WIDGET_CONTROL. Check
out your manual for more info.

Hope this helps.
