Subject: IVolume with Image Plane - Different opacities

---

I am doing something almost identical to the post "programming with itools ", where I have an iVolume tool with an Image Plane, and the image from the Image Plane in the same iTool, on the next view. My question is whether I can programmatically change the opacity of the image, so that it is different from the iVolume opacity, with it still updating when I move the Image Plane on the 3D volume. My volume needs a lot of transparency, but when I do so the image is hardly visible.
