Subject: Matching 2 lists
Posted by David Baker on Sat, 21 Aug 2010 15:11:47 GMT

Hi there,
          I'm wondering if someone can help me. I'm trying to match
two lists of stars together. Where I differ from the standard 1-1
match that match_2d.pro does so well is that I would like to be able
to compute a 1-many match. I.e find any star in list B that is a
possible match to a single star in list A not just the closest.

Many thanks for any help that someone can provide

David
