This may sound strange but yes there is a workaround for getting the console to start working properly again once it is in the disconnected state without restarting the workbench:

1. create an array variable, e.g. a=[1,2]
2. open the variables view
3. at the top right of the variables view is a chevron, click it and select layout -> vertical view orientation
4. select the array variable in the variables view, which shows the value [1,2] in the lower pane
5. the console should now work properly again
