
Subject: problem with 16bit color with IDL

Hi, All,

I am running IDL4_0_1 on Linux 2.0.0. Everything seems normal when I start X windows with 8bit color(color depth 8). But when I use 16 or 24 bit, the colors are all wrong. No error message shown. I have enough video memory so I don't think that is the problem.

Does anyone know how to fix it? or do I have to run IDL at 8bit?
Thanks.

kwofu
