I am interested in inserting an image into Excel spread sheet,
something like

=====

Pro IDL_Write_Excel_Col, FILENAME=FileName

; Create an instance of an Excel Application Object

oExcel = obj_new("IDLcomIDispatch\$PROGID\$Excel_Application")

if ~oExcel then return

; Set this property to 0 to hide the Excel Application

oExcel->SetProperty, visible=1

; Obtain a reference to the workbook object and add new

oExcel->GetProperty, Workbooks=oWkbks

oWkbks->Add

oWkbks->GetProperty, 'Book1', Item=oBookData

; Get a reference to the sheets collection

oBookData->GetProperty, Sheets=oSheets

; Parmamerized property - props can return a value

; (this syntax used in collections) - It's a COM detail.

oSheets->GetProperty, 'Sheet1', Item=mySheetObj

; Obtain a reference to the range object with defined cell(s)

mySheetObj -> GetProperty, 'A1', range = myRangeObj

;myRangeObj->select

; Set a value on the currently selected range

myRangeObj->SetProperty, 'select', value='From IDL'

=====

but an image, any ideas?

Thanks

Maher
