Ah, I misunderstood.

I have a similar set-up. IDL on my right-hand screen and graphics windows displayed on the left-hand screen. When I do this:

```
img = Image(Dist(200))
```

The image appears over the top of my Workbench on the right-hand screen. However, if I do this:

```
img = Image(Dist(200), Location=[50,100])
```

The image appears on my left-hand screen, positioned in the correct location from the upper-left corner.

I can put the image on my right hand screen by doing something like this:

```
img = Image(Dist(200), Location=[1650,100])
```

Is this not what you see?

Cheers,

David
