I have to plot TrueColor pictures in IDL. These pictures contain colors defined as RGB-values. On a TrueColor X-Display everything works fine with about 16 million colors, i get very nice pictures. I want to plot this pictures on a PostScript color printer. But the 'ps' device in IDL only allows 256 colors, which is definitily too less for my pictures. Has someone any idea, how to put my pictures on paper?

Thanks a lot
