I am trying to use PV-WAVE running on a Sun/Solaris system from a
remote PC using "eXcursion" X emulation software. When I display a
plot while running PV-WAVE in interactive mode and that plot gets
covered by another window on the PC, that window is redrawn when
it is uncovered (so long as I set "DEVICE, Retain=2" before display-
ing the plot). But if I am running a C or FORTRAN program that calls
PV-WAVE (via dynamic link) to display a plot and that window is covered
by another window on the PC, that window is NOT redrawn (even when I
set "DEVICE, Retain=2" and/or WINDOW, Retain=2" after calling
waveinit()). Does anyone know how to fix this? Thanks for any help!
