Hi all,

I've written a fairly large widget app, developed on a DEC Alpha. Recently, I started to run it on an SGI (IRIX 5.3, IDL 4.0.1). More and more frequently, I am getting the message "Alarm clock" and am kicked totally out of IDL back to the unix prompt (no other messages). We have a 5-user license for the machine. Does anyone know the meaning of this?

Thanks,

-bob
