I do not know what you mean by "same area". To run a savefile in IDL's VM, the file must contain any routines that are not in IDL's standard library. Which is the purpose of `resolve_all`, so that they can be included when creating the savefile.

That is assuming you want to run it on the VM. If you want to run the routine(s) from the IDL session, the remaining routines (either source or sav files) can be anywhere in IDL's path, or in the current directory.
