Thanks. Another question and I'm just making sure. By using the IDL_IDLBRIDGE object that means obj1, obj2, obj3, obj4 are running in parallel or does obj1 execute first or suspend and then go to obj2. Also does the IDL Bridge object automatically dispatch to different processors because I have a quad core so I would like for each object to be on a separate core. I'm not sure if that's possible. Thanks!
