dear readers,

i have some questions about IDL

- 1. how can i solve differential equations in IDL? i know that the RK4 function do it but it is very obscure, may you introduce a simple method to solve all differential equations?
- 2. what is the simplest way for taking the integrals directly (specially 1D integrals) without write a function?
- 3. How do I define a function that its parameters could be changed in every calling (for example in every step of FOR-DO loop, function return a new value)?
- does functions could return a paramedical equations? if OK how? thank you so much and sorry for my many questions best regards,
