Hello,

I would like to use the sigma_filter.pro on an image in IDL 7.1.

Im a new user and I dont understand how the calling sequence works.

The documentation of the filter says that the calling sequence is:

Result = sigma_filter(image, box_width, N_sigma=(#), /ALL,/MON)

Can someone help me? I try it in IDL command Line without any success.

Thank you,

Max

Url of the sigma_filter.pro
