Hi all,

I have been experimenting with using IDLffLangCat to provide alternate language strings for GUI elements (eg. button text, menu items. I think I have it working reasonably well, but I'm a bit stuck on one point. If I provide some text for a menu item with accented characters (eg. Source des données), it doesn't display properly in the Motif environments (X11 on Mac OS X). Is this an IDL issue? Do I need to set a particular font for the menu that contains this character? Is it an X11 issue? Do I need to use embedded string formatting? Documentation is not much help here, but I hope that someone can shed some light.

Will.
