Hi folks;

Does anyone know how to increase the number of commands stored
in the IDL command buffer (which one can access to scroll back
through the last commands with the up-arrow, etc.)?
I've asked and none of the gurus around here know...
It seems to have about 20 commands stored, but I'd like to
get more. I can use some brute force and scroll up in a window,
and copy/paste commands, but sometimes the output from an IDL program
removes this possibility.
(This is with IDL 2.2.1 - we've got 2.3.? on one of the machines,
not installed institute-wide yet - on Unix Sun workstations/Sparcs)

Thanks!
