Try double-precision, indicated by a 'd' rather than just a '.'

IDL> print, 1948005/100d
      19480.050

When dividing this long integer by a double-precision floating-point
value, the calculation is performed in double-precision,
and you get a few more significant digits than with single-precision
floating-point, which was causing your rounding.

M.
