Subject: fitting with asymmetric errors?

Hi all,

I'm trying to fit a curve to a data set with asymmetric errors. I usually use mpfitexpr when fitting, but cannot see a way to input anything other than symmetric errors (though this is could well be a problem with my understanding rather than the routine!). If mpfitexpr is not the task for the job, is there another routine you would suggest?

Thank you very much for your time! :)

Liz
