
Subject: Extracting cluster indices from a dendrogram

Hello,

I am using the heirarchical clustering tools in IDL to cluster my data, and I can follow the examples in the documentation and get a resulting dendrogram plot just fine. But what I am really interested is specifying a number of clusters and getting a list of which data points are in each cluster. I can do this manually by looking at the dendrogram, but I would like to automate it and just have the program spit out a list of indices to the original array for each cluster.

Any ideas or tips? This seems like it should be simple...
