Hello all,

I need to extract information of each pixel by different land cover classes. I have a land cover map in a vector format. Now, I need to associate this vector information to the image file. So, I rasterized my shape file with the resolution of my image. But, my dimensions of the rasterized land cover maps and the image are not same. I tried to subset my image with the rasterized land cover map, yet the dimensions are not same.

Is there any other way to solve this issue without rasterizing the shape file. Can i get around this issue with ROI.

Thank you
