
Subject: Domain Name Change and Perl Programmer Needed

Folks,

To coincide with the imminent (I promise!) release of this new book, I have changed domain names from www.dfanning.com to www.idlcoyote.com. Some of you (probably not the ones who didn't know what "FSC_" stood for) may have noticed, as there has been some redirection going on for a week or so.

The final move should be today. (It may have already happened.) This shouldn't affect anyone, as the redirect should happen automatically and should be painless. (Have you heard this story before?) But, I would encourage you, if you have the time, to fix your links, etc.

There are some updates to the web site planned. Nothing major, and mostly having to do with an updated shopping cart for the store, which has been a nightmare of its own that I won't go into. In any case, it is not ready yet, but the old store is still working, I believe. I guess we are about to find out. :-)

One of the things I could use, if someone wanted to volunteer some Perl programming time, is a script that would rip through my *.html files and change all instances of "dfanning.com" to "idlcoyote.com". I guess I could figure this out myself, but it is pretty far down on my list and I thought someone here might like to feel *extremely* appreciated!

Cheers,

David
