
Subject: Need look-up-table routine

Hello,

I was about to try to write a routine which will, upon input of a value or array of values, give a corresponding output value or array of values according to a look-up table (also provided as input).

I'm not sure yet whether I need to use interpolation methods, or just nearest-value, but in any case, I thought I should ask around here first, to see if such a routine already exists, either in IDL or somewhere else. Can anyone help?

Thanks,

Adam Ross
